

Instructions (this notebook):

1. Make the first notebook cell a Markdown cell with your name and date.
2. Write a program to prompt the user for hours and rate per hour using input to compute gross pay.
3. Use 35 hours and a rate of 2.75 per hour to test the program (the pay should be 96.25).
4. You should use input to read a string and float() to convert the string to a number.
5. Do not worry about error checking or bad user data.

```
In [1]: hours_worked = float(input("Enter hours:"))
        hourly_rate = float(input("Enter rate per hour:"))
        gross_pay = hours_worked * hourly_rate
        print("Hours worked =", hours_worked, "\nRate per hour =", hourly_rate)
        print("-" * 25)
        print(f"Gross pay = {gross_pay:.2f}")
```

```
Hours worked = 35.0
Rate per hour = 2.75
-----
Gross pay = 96.25
```

```
In [2]: hours_worked = 35
        hourly_rate = 2.75
        gross_pay = hours_worked * hourly_rate
        print("Hours worked =", hours_worked, "\nRate per hour =", hourly_rate)
        print("-" * 20)
        print(f"Gross pay = {gross_pay:.2f}")
```

```
Hours worked = 35
Rate per hour = 2.75
-----
Gross pay = 96.25
```

Test

Program tested with:

- Hours: 35
 - Rate per hour: 2.75
- Output: Gross pay = 96.25
